# OXYSORB<sup>™</sup>

## Granules

### OXYSORB<sup>™</sup>

#### The Green Revolution

The **Green Revolution** refers to a new research that increase water production and agricultural production worldwide.

**OXYSORB<sup>™</sup>** by Watch-Water is the "Product of the Green Revolution" that will save over a billion people from starvation. Water with eutrophication, phosphorus, nitrogen and algae can be now used for drinking and agriculture. We call it green revolution.

### Let's Stop Eutrophication

What is green infrastructure?

- ✓ Improve water quality
- ✓ Reduce hydrant overloading
- ✓ Reduce heavy metals
- ✓ Reduce volatile organic compounds
- ✓ Reduce nutrients like nitrogen and phosphorus

#### Product

OXY (Oxygen Release), SORB (an Adsorber) is a proprietary formulation of Watch-Water Germany. **OXYSORB<sup>™</sup>** granules in water produce a controlled release of Active Oxygen for periods of up to one whole year on a single application. The core of granules **OXYSORB<sup>™</sup>** is a non-hazardous, food grade adsorber to bind and scavenge grade Phosphate, Nitrates, Hydrogen sulfide including (TOC<sub>3</sub>) Toxic organic compounds. Watch-Water's **OXYSORB<sup>™</sup>** has another name "magic bullet" solution in a single dosing oxidation and adsorption. **OXYSORB<sup>™</sup>** technology and the process work to destroy contaminants in just a short period of time.

#### Purpose/Applications

Watch-Water's purpose is to remove contaminants from water, on a Earth's planet's surface. These applications often refer to:

- Oceans, seas, lakes
- Ponds, wetlands
- Rivers, streams, canals,
- Reservoirs, basin, aquifers
- Harbor, lagoons
- Water as well as for water reuse
- Surface and ground waters

Water pollution affects the entire biosphere-plants and organisms living in these **bodies of water**.

## What are blue-green algae?

Blue-green algae (also known as cyanobacteria) are common and natural to our waters and found throughout Vermont. Cyanobacteria thrive in nutrient rich water and can multiply rapidly to form blooms and scum, particularly during the warm days of summer and early fall.

A blue-green algae bloom:

- Resembles thick "pea soup".
- Looks like "spilled paint" on the water's surface.
- Creates a thick mat of foam along the shoreline.
- Is generally green or blue-green in color, although it can be brown, purple or white.
- Is made up of small specks or blobs floating at or just below the water surface.

A blue-green algae bloom is NOT:

- Stringy, made up of long bright grass-green strands that feel either slimy or cottony. This is harmless green algae.
- Mustard yellow in color. This probably is pollen. For a photo gallery of what is and is not a blue-green algae bloom

Find out more on this US Govt. Website:

[http://healthvermont.gov/enviro/bg\\_algae/photos.aspx](http://healthvermont.gov/enviro/bg_algae/photos.aspx)

## What are the health effects?

General health effects caused by exposure to blue-green algae:

- Rashes or other skin irritations.
- Allergy-like reactions, runny nose or sore throat.

Some blue-green algae naturally produce toxins or poisons. When these toxins are ingested in large amounts they can cause:

- Sharp, severe stomach problems like diarrhea and vomiting.
- Liver damage that may take hours or days to show up in people or animals.
- Numb limbs, tingling fingers and toes or dizziness.

Possible health effects of animal exposure to a toxic bloom:

- Weakness, staggering
- Difficulty breathing
- Convulsions
- Vomiting or diarrhea

Signs of a toxic bloom may include: a large number of dead fish, waterfowl or other animals, or sudden, unexplained sickness or death of a cat or dog that has been exposed. It is not possible to tell if cyanobacteria are toxic by looking at them.

## Why OXYSORB™?

Answer: Only because of **eutrophication**.

Eutrophication and algae blooms in the frequent outbreak have become a major **environmental problem** facing the world.

Outbreaks of algae blooms in the agriculture, tourism landscape, drinking water have a serious impact. Watching these problems, it has shown that an outbreak of **Cyanobacteria** control 80% produce toxins, and these toxins

can go directly to the source of drinking water and harm human health, but also in the aquatic food chain (fish, shrimps and so on) through water enriched products, thus directly or indirectly threaten human health. **OXYSORB™** is the most efficient, simple, **environment friendly**, low cost method to adsorb nitrogen and phosphorus and stop algae blooms and all the current problems are solved

— BlueWaterpapers.com

*Using OXYSORB™ in lakes, ponds, rivers, reservoirs and wastewater will immediately reduce Geosmins, Trihalomethanes, Chloramines, Phosphates, Nitrates and improve taste and odor from water reservoirs!*

## Odor Removal:

The most common problem is a lack of dissolved **Oxygen** which kills fish and increases the amount of coliform bacteria and Naegleria ("brain-eating amoeba"). the cause of these problems in **nutrient\_overloading** or **eutrophication**. The process by which a body of water acquires a high concentration of nutrients, especially **phosphates** and **nitrates**. These typically promote excessive growth of **algae**. As the algae die and decompose, high level of **organic** matter and the decomposing **organisms** deplete the water of available **oxygen**, causing the death of other organisms, such as **fish**. **Eutrophication** is a natural, slow aging process of a **water body** but **OXYSORB™** as a **water body** greatly speeds up the process to produce a high amount of **oxygen** and adsorbs all bad phosphates and nitrates. Increasing oxygen throughout the

water system allows us to start a sequence of events that provides (1) **aquatic weed control**, (2) improves water quality, (3) reduces Geosmins, Trihalomethanes and Chloramines, (4) reduces organic muck and harmful gases (like  $H_2S$ ), (5) kills coliform bacteria, (6) removes phosphates and nitrates and stop **Nuisance Algae Growth** and you will **watch water** is clear and at the same time fishes (and other aquatic life form) are healthy and the improved water quality provides safer swimming conditions by reduce organics.

**OXYSORB™** delivers cost effective solutions for ponds and lakes by oxygenating the lower parts of artificial or natural lakes/ponds, as well as wastewater and effluent. Only **OXYSORB™** can provide real oxygen with function of adsorption of harmful substances over a long period of time.

OXYSORB™ brings life to the Water
